

Class 7 Maths – Data Handling

Data Handling is the process of collecting, organizing, representing, and interpreting data. We use data handling in daily life to understand information clearly and make decisions easily.

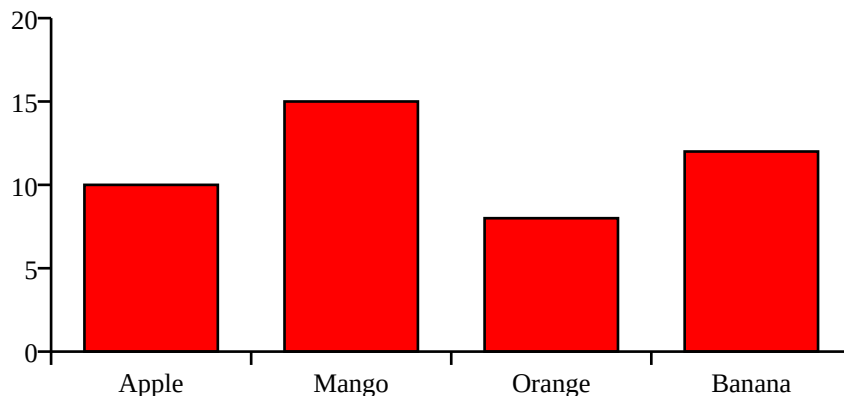

Types of Data Representation:

1. **Tally Marks** – Used to count items quickly.
2. **Pictograph** – Uses pictures or symbols to represent data.
3. **Bar Graph** – Uses bars of equal width to compare data.
4. **Double Bar Graph** – Compares two sets of data together.

Example Table:

Favourite Fruit	Number of Students
Apple	10
Mango	15
Orange	8
Banana	12

Simple Bar Graph:

Mean, Median and Mode:

• **Mean** = Sum of observations ÷ Number of observations.

Example: 4, 6, 8 → Mean = $(4+6+8)/3 = 6$

• **Median** = Middle value of arranged data.

Example: 2, 5, 7 → Median = 5

• **Mode** = Most frequently occurring value.

Example: 3, 4, 4, 5 → Mode = 4

Conclusion:

Data handling helps us organize information in an easy and understandable way. Graphs and charts make comparisons simple and improve understanding.
